

Golf Pond Aeration

Golf Courses around North America have traditionally treated their ponds with pond chemicals to address pond problems such as algae, weeds, color, smell etc...

This approach is extremely expensive, damaging to the environment and bad for the pond. The majority of golf courses spend several thousand dollars per/yr in pond chemicals in an effort to keep their water looking healthy and clean.

This effort is not only expensive but it is not a sustainable approach to keeping a healthy clean pond.

Outdoor Water Solutions has developed a windmill aeration system that provides these golf course ponds with adequate amounts of oxygen in order to burn off excess nutrients and organic matter that causes poor pond health.

With a payback of less than 1 year, very little maintenance and no further need for pond chemicals. Golf Courses are helping both the environment and their profits.
